

## HANGER APPARATUS

## ABSTRACT

5 A hanger apparatus is fabricated of a strand of  
6 material that is formed into a plurality of coils of  
7 incrementally decreasing diameter to fabricate a tapered,  
8 hollow helix. A hook or other engagement means is  
9 integrally formed at one end of the helix. The helix is  
10 compressively or frictionally engaged with an opening in a  
11 selected substrate to provide a hanger assembly for  
12 receiving and holding a selected object.
